TECHNICAL SKILLS

Full-Stack Software Engineer (6+ years of project experience) | **Programming Languages:** TypeScript | JavaScript | Java | Python | SQL; **Frontend:** React | Next.js | HTML5 | CSS3 | Tailwind CSS | Redux; **Backend & APIs:** Node.js | Spring Boot | Express.js | REST APIs | Microservices | Auth.js | JWT Authentication | Serverless Framework; **Databases & ORM:** PostgreSQL | DynamoDB | Prisma | Supabase | S3; **Cloud & DevOps:** AWS | AWS Lambda | API Gateway | Cognito | Docker | Kubernetes | GitHub Actions | CI/CD | Vercel | CloudWatch; **Testing & Quality:** Jest | Unit Testing | Integration Testing | Code Reviews | SonarQube | Prometheus | Grafana; **Architecture & Practices:** Distributed Systems | Clean Architecture | Event-Driven Design | RabbitMQ | ONNX | scikit-learn | Agile/Scrum | Git | Jira | Design Patterns | SOLID Principles | AI-assisted Development | Claude Code | Cursor

WORK EXPERIENCE

07/2023 – Present

Full-Stack Software Developer

Makaveli Technology Limited, Nigeria

Project: Naijastore – Nigeria-based e-commerce platform providing secure online shopping, product management, authentication, and checkout functionality for small businesses.

- Collaborated with a distributed development team to design and implement production-ready full-stack features using Next.js and TypeScript.
- Developed secure authentication and user management using Auth.js and Supabase, enabling protected customer accounts and role-based access.
- Built product catalog, shopping cart, and checkout functionality using Prisma ORM and PostgreSQL, supporting a seamless purchasing experience.
- Optimized server-side rendering and frontend performance with Next.js, reducing the initial page load time from approximately 2.3 seconds to under 1 second.
- Deployed production releases on Vercel and participated in architecture discussions, feature planning, debugging, and code reviews.

Technologies used: TypeScript | Next.js | Supabase | Prisma | Auth.js | PostgreSQL | Tailwind CSS | Vercel | REST APIs | Git

Project: Prevent Asbestos – AI-powered workplace safety application

- Designed an agentic Retrieval-Augmented Generation (RAG) workflow using 17 domain knowledge sources with local embeddings, eliminating the need for an external vector database.
- Developed Node.js REST APIs integrating GPT-4o Vision with domain-specific prompting to generate structured asbestos risk assessments.
- Containerized the solution with Docker and implemented automated validation to improve response consistency during live demonstrations.

Technologies used: Python | Node.js | Express | GPT-4o Vision | RAG | Docker | REST APIs | Local Embeddings

Project: Cloud-Native Serverless Backend Platform – Backend platform providing authentication, task management, and automated cloud deployment for small business applications.

- Designed and implemented a serverless backend using AWS Lambda, API Gateway, DynamoDB, and Cognito following a microservices architecture.
- Migrated authentication from Auth0 to AWS Cognito with a custom Lambda authorizer while maintaining backward compatibility.
- Built automated CI/CD pipelines using GitHub Actions and Serverless Framework, reducing deployment time from approximately 40 minutes to under 10 minutes.
- Developed comprehensive unit and integration tests achieving 100% code coverage across business logic. Built a React frontend supporting OAuth2 Authorization Code Flow with PKCE.

Technologies used: TypeScript | AWS Lambda | API Gateway | DynamoDB | AWS Cognito | React | GitHub Actions | Jest | Docker

03/2018 – 07/2022

Full-Stack Software Developer

Venus Medicare Limited, Abuja, Nigeria

Project: MediGuard – Internal health insurance management platform serving a corporate Health Maintenance Organization (HMO) with over 30,000 enrolled members.

- Developed full-stack features using Node.js, React, and PostgreSQL to support client onboarding, healthcare plan administration, and provider claims processing across the insurance platform.
- Designed and implemented REST APIs enabling healthcare providers to submit monthly claims electronically, reducing manual processing time from approximately three days to less than one day.
- Built secure workflows for claim validation, review, and routing to finance teams, reducing processing errors by approximately 25% through improved business validation rules.
- Optimized PostgreSQL queries and backend services to improve API response time from around 2.2 seconds to under 900 ms during peak claim processing periods.

Technologies used: Node.js | React | PostgreSQL | AWS | Docker | REST APIs | Git | Agile | CI/CD

EDUCATION

09/2022 – 06/2023

Postgraduate Studies, Computer Science
Linköping University, Linköping, Sweden

09/2008 – 08/2013

Bachelor of Engineering, Computer Engineering
Caritas University, Enugu, Nigeria

LANGUAGE SKILLS

English (Mother tongue) | Swedish (B1) | German (A1, currently learning)
